Database pada umumnya: SQL

- Data berupa tabel berisi kolom dan baris
- Tabel dapat mempunyai hubungan dengan tabel lain
- Kolom mempunyai tipe data yang sudah ditentukan dari awal

NoSQL

redis

Couchbase

elasticsearch

Lepas dari paradigma database SQL

Jenis database NoSQL

- Document store
- Key-value store
- Wide-column store
- Graph database

NoSQL Document store

- Data disimpan dalam bentuk **document**
- Antar dokumen dapat memiliki struktur yang berbeda-beda
- Contoh: MongoDB

NosQL Key-value store

- Data disimpan dalam bentuk pasangan key dan value
- Key biasanya berupa string, dan Value biasanya dapat diisi jenis data apa saja
- Contoh: Redis

NoSQL Wide-column store

- Data disimpan dalam bentuk baris dan kolom
- Setiap baris dapat mempunyai kolom yang berbeda
- Contoh: Cassandra

NoSQL Graph database

- Data disimpan dalam bentuk Graph
- Sebuah Graph terdiri dari beberapa Node dan Edge
- Contoh: Neo4j

Why NoSQL?

- Bentuk data tidak sesuai dengan konsep data SQL
- High-availability lebih penting
- Perlu menyimpan banyak data

SQL vs NoSQL

SQL	NoSQL
Vertical scaling	Horizontal scaling
ACID	Eventual consistency
Replication	Advanced high-availability

NoSQL use cases

- Content Management System
- Pengumpulan data
- Data set AI
- Algoritma rekomendasi

Capella Empowers Nexon to Achieve Faster Time to Market Across Multiple Regions

Santa Clara, Calif. - June 14, 2022 - Couchbase, Inc. (NASDAQ: BASE), provider of a leading modern database for enterprise applications, today announced that **Nexon**, a global leader in Virtual World games and massively multiplayer online role-playing games (MMORPG) selected **Couchbase Capella** Database-as-a-Service (DBaaS) for greater developer agility. With Capella, Nexon achieved a faster time to market with its launch of Blue Archive, a new game first released in Korea in November 2021.
